

It is well known that favorable conditions like the ideal temperature, light, and humidity can rapidly increase the growth of plants. In underground places, that can be achieved and could even have economic potential, at least for exotic plants.

There is logic to having underground barns, too. You can protect the stock and maybe even control the exhaust of methane, which pollutes the environment.

I strongly believe that underground barns can provide enough light and food and can be as or more comfortable than those that are above ground. Even underground pastures are not out of the question.
